

Motorsport Fuel Injection Throttle Bodies and Induction Systems

Performance

Reliability

Lightness

Value

Jenvey Dynamics manufacture electronic fuel injection (EFI) individual throttle bodies (ITB) and induction systems for all levels of motorsport from road going sports cars, kit cars and track day vehicles to World Superbike, S2000 spec Rally cars and World and British touring cars. We also manufacture individual throttle bodies and induction systems for low volume sportscar and motorcycle manufacturers having often taken charge of the design and development process.

Jenvey Dynamics design, develop and manufacture all significant throttle body and induction system components in-house including throttle body housings, spindles, butterflies, levers and fuel rails. This enables the close control of quality, research and confidentiality, essential in all forms of motorsport.

Focusing on performance, reliability, lightness and value, backed up by our own motorsport success, we know what it takes to win.
